

Project Design Phase

Proposed Solution Template

Date	26 June 2026
Team ID	
Project Name	Automated Network Request Management
Maximum Marks	2 Marks

Proposed Solution Template:

S.No	Parameter	Description
1	Problem Statement (Problem to be solved)	Organizations often manage network service requests such as VPN access, firewall rule changes, VLAN creation, IP address allocation, switch port activation, and network device configuration through emails, phone calls, or manual ticketing processes. These methods result in delayed approvals, inconsistent request handling, limited visibility, poor communication between users and the network team, and difficulty in tracking request progress and maintaining audit records.
2	Idea / Solution Description	Develop a ServiceNow-based Automated Network Request Management System that enables employees to submit network service requests through the Service Catalog. The system validates request information, stores request details in the u_network_database table, automatically routes requests for managerial approval, creates implementation tasks in the u_network_task table upon approval, assigns tasks to the appropriate Network Engineer, sends automated email notifications throughout the request lifecycle, and allows users to monitor request status until successful completion.
3	Novelty / Uniqueness	The solution integrates ServiceNow Service Catalog, Flow Designer, automated approvals, assignment rules, role-based access control, email notifications, custom tables, and real-time request tracking into a single centralized platform. By automating the complete network request lifecycle, the application minimizes manual effort, standardizes request processing, improves operational efficiency, and provides complete auditability.
4	Social Impact / Customer Satisfaction	The application improves employee productivity by providing a faster and more transparent method for requesting network services. Automated workflows reduce approval delays, improve communication among employees, managers, and network engineers, enhance service reliability, and increase customer satisfaction through real-time status updates and timely request fulfillment.
5	Business Model (Revenue Model)	The solution is designed for organizations that use ServiceNow as their IT Service Management platform. It can be deployed as an enterprise application to automate internal network operations. Future enhancements may enable deployment as a reusable ServiceNow application or enterprise solution that can be adopted by multiple organizations through licensing or subscription-based service models.
6	Scalability of the Solution	Built on the ServiceNow cloud platform, the application can efficiently support growing numbers of users, network requests, departments, and business units. Additional network services, approval workflows, integrations with

Configuration Management Database (CMDB), monitoring tools, analytics dashboards, SLA management, and AI-assisted request routing can be incorporated without requiring major architectural modifications.
